# Right-handed neutrinos

## Standard Model of Elementary Particles

three generations of matter (fermions)			interactions / force carriers (bosons)		
	I	II	III		
mass	$\approx 2.16 \text{ MeV}/c^2$	$\approx 1.2730 \text{ GeV}/c^2$	$\approx 172.57 \text{ GeV}/c^2$	0	$\approx 125.20 \text{ GeV}/c^2$
charge	$\frac{2}{3}$	$\frac{2}{3}$	$\frac{2}{3}$	0	0
spin	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	1	0
QUARKS	<b>u</b> up	<b>c</b> charm	<b>t</b> top	<b>g</b> gluon	<b>H</b> higgs
	<b>d</b> down	<b>s</b> strange	<b>b</b> bottom	<b><math>\gamma</math></b> photon	
LEPTONS	<b>e</b> electron	<b><math>\mu</math></b> muon	<b><math>\tau</math></b> tau	<b>Z</b> Z boson	SCALAR BOSONS
	<b><math>\nu_e</math></b> electron neutrino	<b><math>\nu_\mu</math></b> muon neutrino	<b><math>\nu_\tau</math></b> tau neutrino	<b>W</b> W boson	
	$< 0.8 \text{ eV}/c^2$	$< 0.17 \text{ MeV}/c^2$	$< 18.2 \text{ MeV}/c^2$	0	
	0	0	0	1	
	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$	$\pm 1$	
				1	
					Gauge bosons Vector bosons

- All observed neutrinos are left-handed
- Right handed neutrinos (if any), must be different from left-handed ones
- Could they be of a higher mass?

# Particle Detector

Different SM particles interact differently with the detector.

Only some particles can be detected directly; others have to be inferred from some combination of the ones that *can* be detected

# Final States

Proposed Feynman diagram:

**Signal** (what we're looking for)

Right Handed Neutrinos: final state - 3 leptons (electrons or muons)

**Background**

A bunch of other processes that could also have the same final state of 3 leptons -  $WZ$ ,  $ZZ$ ,  $t\bar{t}$ , etc.

# What next?

- Make simulations of different masses of RHNs
- Plot different quantities with simulated data and study their properties
- See how it can be differentiated from background

Simulations of several hypothetical masses of RHNs of both muon-type and electron-type were used

Masses: 10 GeV, 20 GeV, 200 GeV

# Similarity between $N_{\mu}$ ( $m = 10$ GeV) and $N_{\mu}$ ( $m = 20$ GeV)

Dilepton invariant mass

Missing  $E_T$

# Difference between $N_\mu$ ( $m = 10$ GeV) and $N_\mu$ ( $m = 200$ GeV)

# Analysis

Stack all background plots

Overlay the signal

See where cuts can be made such that signal is high and background is low

Aim: Improve  $S/\sqrt{B}$  without compromising on signal efficiency

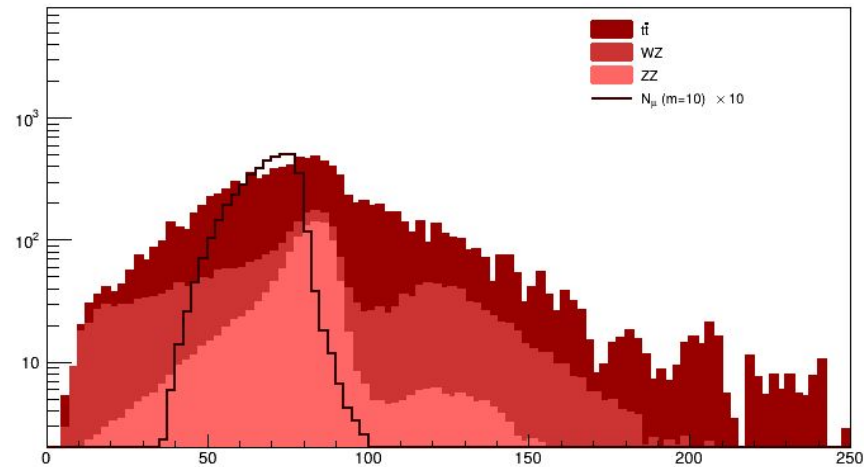

# Cuts for low-mass region

Initial  $S/\sqrt{B}$ : 166.291

$M_{II} < 75$  GeV

$S/\sqrt{B}$ : 262.514

$35 < M_{III} < 80$  GeV

$S/\sqrt{B}$ : 387.761

- Initial  $S/\sqrt{B} = 166.291$
- Initial signal efficiency = 0.267909

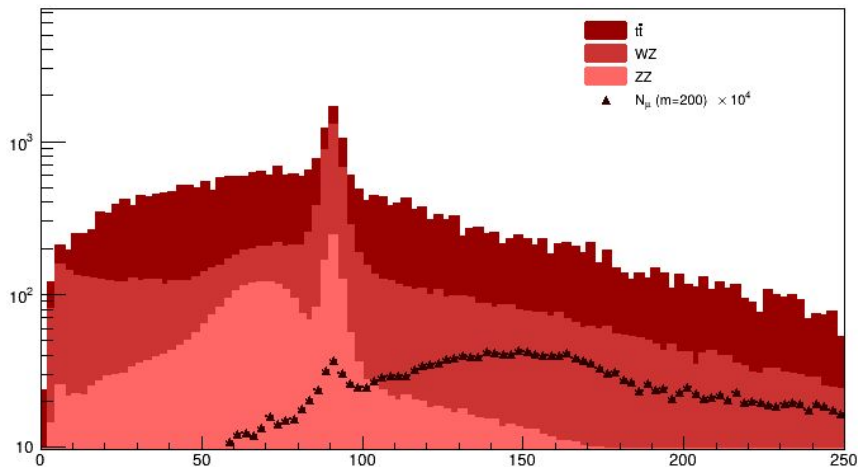

Cuts:

- $p_T(l^0) > 25 \text{ GeV}$
- $M_{ll} < 75 \text{ GeV}$
- $35 < M_{lll} < 80 \text{ GeV}$
- $\Delta R_{L0L1} < 0.4$  or  $\Delta R_{L0L1} > 1.8$
- $\Delta R_{L1L2} < 1$  or  $1.9 < \Delta R_{L1L2} < 4.2$
- $m_T^0 < 100 \text{ GeV}$
- $m_T^2 < 50 \text{ GeV}$
- $\Delta R_{(L1L2 - MET)} < 4$
- $L_T < 90 \text{ GeV}$
- $\Sigma M_{ll} < 120 \text{ GeV}$

- Final  $S/\sqrt{B} = 571.903$
- Final signal efficiency = 0.203351

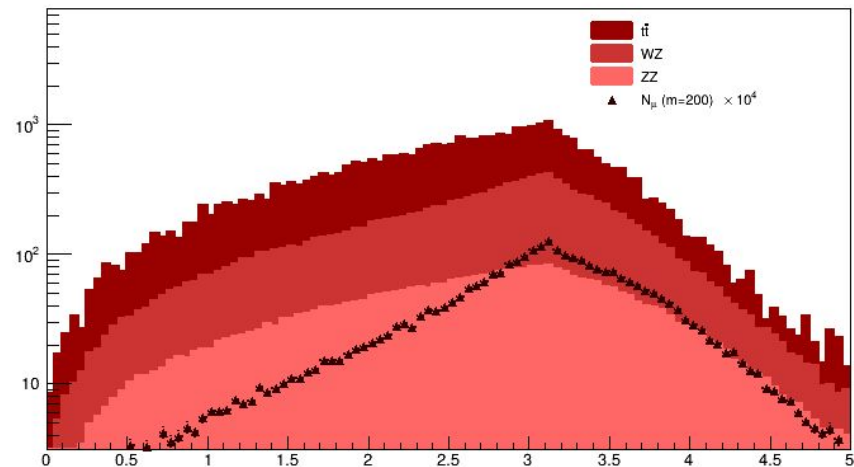

# Cuts for high-mass region

Initial  $S/\sqrt{B}$ : 131.861

$M_{ll} > 110$  GeV

$S/\sqrt{B}$ : 204.08

$\Delta R_{(LOL1 - MET)} > 0.5$

$S/\sqrt{B}$ : 204.99

- Initial  $S/\sqrt{B} = 131.861$
- Initial signal efficiency = 0.605997

Cuts:

- $p_T(l^0) > 50 \text{ GeV}$
- $p_T(l^1) > 30 \text{ GeV}$
- $M_{ll} > 110 \text{ GeV}$
- $1 < \Delta R_{L0L1} < 4.5$
- $\Delta R_{L0L2} < 4.5$  and  $\Delta R_{L1L2} < 4.5$
- $\Delta R_{(L0L1 - MET)} > 0.5$
- $\Delta R_{(L1L2 - MET)} < 4$
- $L_T + MET > 200$
- $\Delta\phi_{(L0 - L1L2)} > 0.7$

- Final  $S/\sqrt{B} = 234.705$
- Final signal efficiency = 0.436236

**Thank You!**
