

Simulating and Fitting HEP Phenomena

By Piyush Kolhe

What is HEP?

- HEP stands for High Energy Physics, where small particles and their properties are probed.
- We collide particles (for example, two protons) at high energies (TeV scale) to study the fundamental particles and their interactions with each other.
- What's inside a proton?

What is a Parton?

- At high energies, a proton is not simply a combination of two up quarks and one down quarks.
- It is more of a sea of partons, the three quarks (u,u,d) are known as the valence partons.

The Standard Model

mass →	$\approx 2.3 \text{ MeV}/c^2$	$\approx 1.275 \text{ GeV}/c^2$	$\approx 173.07 \text{ GeV}/c^2$	0	$\approx 126 \text{ GeV}/c^2$
charge →	$2/3$	$2/3$	$2/3$	0	0
spin →	$1/2$	$1/2$	$1/2$	1	0
	u up	c charm	t top	g gluon	H Higgs boson
QUARKS	$\approx 4.8 \text{ MeV}/c^2$	$\approx 95 \text{ MeV}/c^2$	$\approx 4.18 \text{ GeV}/c^2$	0	
	$-1/3$	$-1/3$	$-1/3$	0	
	$1/2$	$1/2$	$1/2$	1	
	d down	s strange	b bottom	γ photon	
	$0.511 \text{ MeV}/c^2$	$105.7 \text{ MeV}/c^2$	$1.777 \text{ GeV}/c^2$	$91.2 \text{ GeV}/c^2$	
	-1	-1	-1	0	
	$1/2$	$1/2$	$1/2$	1	
	e electron	μ muon	τ tau	Z Z boson	
LEPTONS	$< 2.2 \text{ eV}/c^2$	$< 0.17 \text{ MeV}/c^2$	$< 15.5 \text{ MeV}/c^2$	$80.4 \text{ GeV}/c^2$	
	0	0	0	± 1	
	$1/2$	$1/2$	$1/2$	1	
	ν_e electron neutrino	ν_μ muon neutrino	ν_τ tau neutrino	W W boson	
				GAUGE BOSONS

Colour

- Quarks and gluons have colour
- Quarks have one colour
- Gluons have one colour and one anti-colour
- Quarks and gluons are also referred to as “coloured particles”
- Colour confinement

Red

Green

Blue

Anti-Red

Anti-Green

Anti-Blue

Colour Confinement and Hadronization

- Implications of colour confinement: a coloured particle cannot be isolated, i.e., only colour-neutral particles can be isolated (and therefore detected)
- Some of the energy and momentum of the particle goes into making other coloured particles which form hadrons, making a jet

Estimating Background

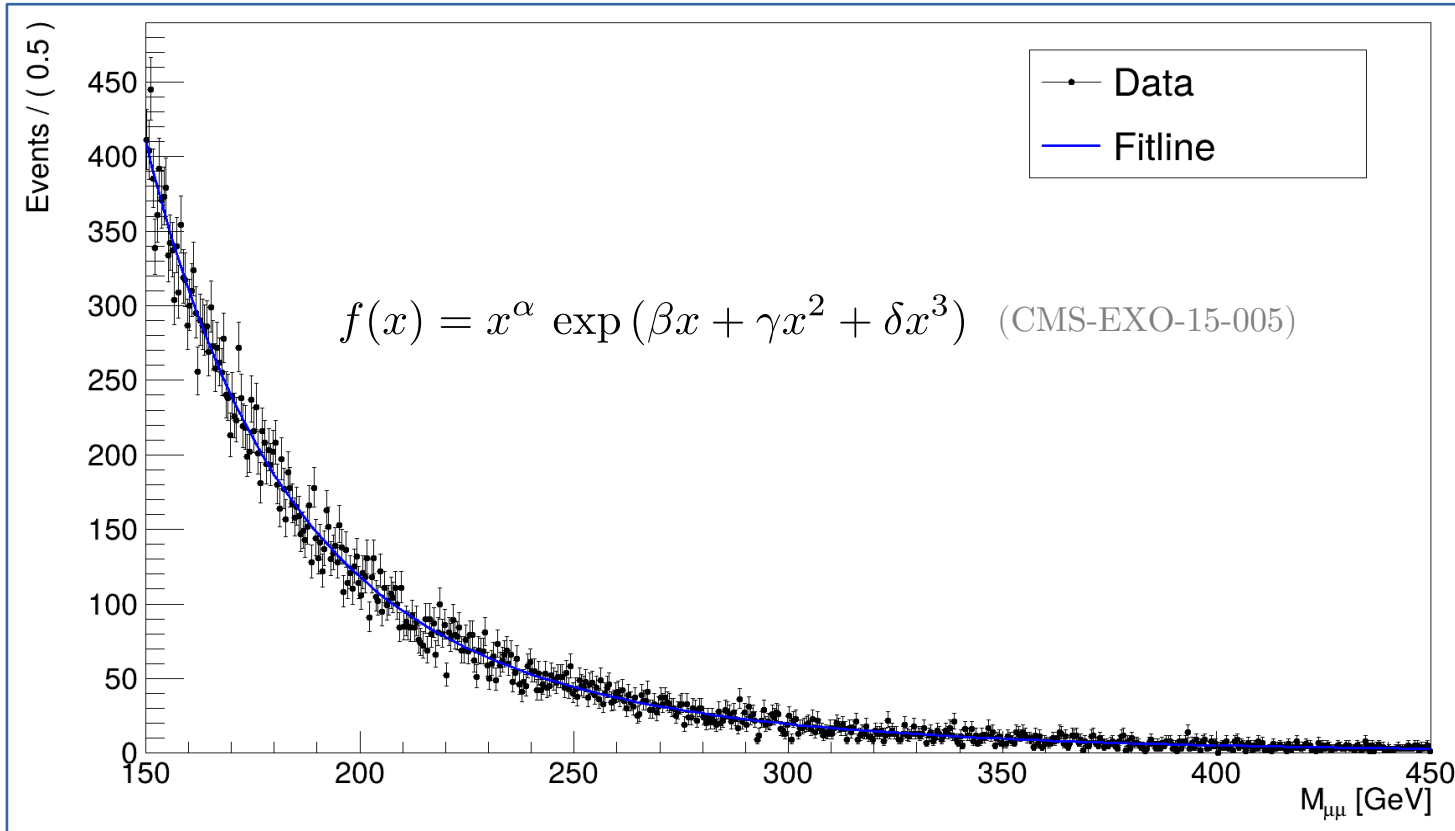

What is background?

$X \rightarrow \mu^+ \mu^- \longrightarrow \text{Signal}$

$\left. \begin{array}{l} \gamma^* \rightarrow \mu^+ \mu^- \\ Z \rightarrow \mu^+ \mu^- \\ J/\psi \rightarrow \mu^+ \mu^- \end{array} \right\} \text{Background}$

How will we tell signal and the background apart?

An example of a fit

Events

Diverging

Converging

$M_{\mu\mu}$ [GeV]

Acknowledgements

First, I'd like to thank prof. Sourabh Dube and his research group for their teachings and guidance throughout the duration of my project.

Second, I'd like to thank L2L for giving me an opportunity to talk about my work.

Thank You
