

Tachyons

Abhilash Sengupta

“Anything that is not forbidden is compulsory.”

-Murray Gell-Mann

What is a tachyon?

- Tachyons are hypothetical superluminal particles.
- The particle number of tachyons is not Lorentz invariant (will be explored a bit later)

What is a tachyon?

- Tachyons are hypothetical superluminal particles.
- The particle number of tachyons is not Lorentz invariant (will be explored a bit later)
- No! We have not yet detected/created tachyons.

Glossary

- **Tardyons:** Particles with subluminal ($\beta < 1$) velocity which can be observed at rest and have a non-zero rest mass.
- **Luxons:** Massless particles with velocity of light ($\beta = 1$).

FIG: TARDYONS
(class I)

$$E^2 - p^2 = m^2 = 0$$

FIG: LUXONS
(class II)

$$m = im_*$$

FIG: TACHYONS
(class III)

Tachyons (sort of) break causality

Frame O' is moving
with velocity β wrt O

FIG: Tachyon emission as observed from 2 different frames

But this does not just happen for Tachyons!

Fig: Space-time from the frame of an observer with $-1 < \beta < 1$

Temporal ordering

- Temporal order may reverse if $\beta < \beta_r^{-1}$. This is, however, only a problem when this situation prevails with change in β .
- From the velocity addition formula,

$$\beta' = \frac{\beta + \beta_r}{1 + \beta\beta_r}$$

where, β' is the velocity of the particle observed from frame O' .

β oscillates from -2 to 2

Reinterpretation Principle

Negative-energy tachyons propagating backward in time are interpreted as Positive-energy tachyons propagating forward in time.

Imaginary Mass?

- For Tardyons, when $\beta = 0$,

$$E_{rest} = m_{rest}$$

- But for Tachyons, $\beta > 1$. Rest mass is not an observable quantity and thus it being imaginary is not an issue.
- Accordingly, “rest” energy will also never be imaginary.

$$E = \frac{m}{\sqrt{1 - \beta^2}} = \frac{\pm m_*}{\sqrt{\beta^2 - 1}} \in \mathbb{R}$$

$$p = \frac{m\beta}{\sqrt{1 - \beta^2}} = \frac{\pm m_*\beta}{\sqrt{\beta^2 - 1}} \in \mathbb{R}$$

Proper length and time need to be imaginary?

$$l = \lambda \sqrt{1 - \beta^2} = i\lambda \sqrt{\beta^2 - 1}$$
$$t = \frac{\tau}{\sqrt{1 - \beta^2}} = i \frac{\tau}{\sqrt{\beta^2 - 1}}$$

Here, l and t are the length and time. λ and τ are the proper length and time.

The Observer

- All observers have real mass and are Tardyonic, so β between 2 such co-ordinate systems can never exceed 1.
- But from the “rest” frame of reference of a Tachyon, no observer is ever at rest.
- λ and τ are unobservable for a Tachyon, and thus they need not be real.

Tachyon-Tardyon interactions

- Consider a tachyon (imaginary mass $m = im_*$) with the initial 4-momenta (\vec{p}_0, E_0) .
- Also consider a tardyon (real mass m') with the initial 4-momenta (\vec{p}'_0, E'_0) .
- After collision, let their final 4-momenta be
$$(\vec{p}, E) \text{ \& } (\vec{p}', E')$$
respectively.
- From the laws of Energy and Momentum Conservation we obtain,

$$E_0 + E'_0 = E + E'$$

$$\vec{p}_0 + \vec{p}'_0 = \vec{p} + \vec{p}'$$

$$E_0^2 - p_0^2 = E^2 - p^2 = m^2 < 0$$

$$E_0'^2 - p_0'^2 = E'^2 - p'^2 = m'^2 < 0$$

Viewed from a reference frame where all the energies are positive, we observe an ordinary elastic 2-particle collision.

However, viewed from a frame where the Tachyon has –ve energy, the Reinterpretation Principle has to be employed again.

Reinterpretation Principle in action!

Initial condition:

Tardyons with 4-momentum (\vec{p}_0', E_0') colliding with
2 Tachyons with 4-momenta (\vec{p}_0, E_0) and $(-\vec{p}, -E)$ respectively

After collision,

$$\begin{aligned}\vec{p}_0 + \vec{p}_0' + (-\vec{p}) &= \vec{p}' \\ E_0 + E_0' + (-E) &= E'\end{aligned}$$

$$\begin{aligned}E_0^2 - p_0^2 &= (-E)^2 - (-p)^2 = m^2 < 0 \\ E_0'^2 - p_0'^2 &= E'^2 - p'^2 = m'^2 > 0\end{aligned}$$

So What?

Alvarez Criterion

$$\mu = P \times \sigma$$

μ = Merit of an experiment,
 P = Probability of its success,
 σ = Significance of result

Alvarez Criterion

$$\mu = P \times \sigma$$

μ = Merit of an experiment,
 P = Probability of its success,
 σ = Significance of result

For Tachyon detection, $P = 0$; $\sigma = \infty$

Most notable attempts to detect Tachyons

- During 1963-65 Torsten Alväger and Peter Erman, at the Stockholm Nobel Institute, attempted to observe emission of charged Tachyons from a strong beta-ray source and attempted to look for meta-electrons.
- A subsequent experimental search for tachyons by means of their Cherenkov Radiation effect was carried out by Torsten Alväger and M.N. Kreisler at the Penn-Princeton Accelerator. They bombarded lead with gamma rays from a 5-mCi Cesium-134 source and **assumed** the creation of charged tachyon pairs in the surrounding lead shield.

Probably why we didn't detect any Tachyons yet

- Tachyons might just be neutral.
- If charged Tachyons do, in fact, exist their detection can be shown to be extremely difficult. Mathematically, we begin from the energy loss per unit length,

$$\frac{dE}{ds} = -4\pi^2 Z^2 e^2 \int \left(1 - \frac{1}{\beta^2 n^2}\right) v dv = \frac{-Z^2 e^2 m_*^2 E^2}{2p^2}$$

Where, Ze = tachyon's charge; β = tachyon's velocity;
 n = Refractive index; v = Frequency of emitted radiation

Letting, E_i = initial energy of the Tachyon and E_f = final energy of the Tachyon. The distance travelled during this radiation is,

$$s = \frac{2}{Z^2 e^2 m_*^2} [E_i - E_f + m_*^2 (1/E_f - 1/E_i)]$$

If $E_i \approx m_*$ and $E_i \gg E_f$, then we can approximate

$$s \approx \frac{2}{Z^2 e^2 E_f}$$

**There was a young lady named Bright
Whose speed was far faster than light.
She went out one day
In a relative way
And returned the previous night.**

-Arthur Henry Reginald Buller

Possible solutions?

1. Tachyons only exists as virtual particles
2. By some as-yet-not-understood “quantum” effect information sent into the past is removed to avoid paradoxes.
3. There exists some **PREFERRED INERTIAL FRAME**.

Preferred Inertial Frame

- E.C. George Sudarshan and O.M. Bilaniuk settle on the existence of such an inertial frame.
- They postulate that the number of tachyons is finite in this preferred frame.

Preferred Inertial Frame

- E.C. George Sudarshan and O.M. Bilaniuk settle on the existence of such an inertial frame.
- They postulate that the number of tachyons is finite in this preferred frame.
- **Only those signals which carry both information and energy in the same direction as seen in the standard frame are possible.**

Other (almost as radical, if not more) solutions

- Roger Newton asks why we cannot have an effect which precedes its cause in time. After all, it is not a contradictory situation in the sense of mathematical logic.
- Paul L. Csonka had undertaken to discredit the principle of causality by devising an ingenious time-symmetric theory of elementary interactions.
- Ya. P. Terletskii considers causality principle to be only a macroscopic law which need not necessarily be followed at microscopic scales. He defines “**signal**” to be any propagating localised disturbance which carries energy and negative entropy. Similarly, he describes an “**antisignal**” to be a localised disturbance which upon emission decreases the entropy of the receiver during absorption.

The Thermodynamic Reinterpretation Principle

- Consider a reversible superluminal signal, and then by a Lorentz transformation, reverse the emitter and receiver's position, in turn making the signal an anti-signal.
- Of course, this problem can be circumvented by considering all Tachyons to be zero-signals but the transference of entropy is much more consistent with our understanding of Information theory.

The Thermodynamic Reinterpretation Principle

- Consider a reversible superluminal signal, and then by a Lorentz transformation, reverse the emitter and receiver's position, in turn making the signal an anti-signal.
- Of course, this problem can be circumvented by considering all Tachyons to be zero-signals but the transference of entropy is much more consistent with our understanding of Information theory.
- To allow superluminal signals to be more than reversible microprocesses, we introduce a **Thermodynamic Reinterpretation Principle**. Which simply perceives antisignals travelling back in time as signals propagating forward in time!
